The sub-judices of vascular nature are present in around the 70% of the erectile dysfunctions "in toto."

Up to year needle this pathology was studied and classified with diagnostic means exclusively from the macroscopic viewpoint (echo-color-Power-Doppler penieno dina - mico, Dinamic Infusional Cavernometry, possible Dinamic Morfologic Cavernosography etc.). For a while, in a lot of pathologies and, among these also those concerning the sexual sphere there is also an interest of the component micro-circulatory independently or no from the involvement of the macro-circulation.

The Videocapillaroscopia, the Optic Probe and the Laser-Doppler they are the examinations employed in the study of the micro-circulation. We adopt only of routine the first methodic and we employ the Laser-Doppler only for the search or for the monitoring of particular clinical cases.

From the therapeutic viewpoint today the Andrologia has available techniques innovative, effective and little invasive as the oxygen-ozone therapy.

The patients that suffer from vascular injuries not yet important, but already envoys in evidence with specific examinations as the Echo-color-Power-Doppler and the Video-capillaroscopia, and the patients subject affections from more severe pathologies within a rehabilitative therapy multipoints, thick times also post-surgical (as after corrective surgery of "veno-occlusive dysfunctions" cavernous) can draw I profit of it.

We have appraised 420 patient affections from erectile insufficiency, owed to micro-vascular damage. Such patients have been treated with:

Association of 02/03 therapy (for by systemic infusional), topical application of base drugs of fosfatidilcolina-trojerutina or ginkgo biloba, through a detail "patch", recently from us set, since from a few years the so-called one has been recognized "Therapy T.E.B". that it consists in the possibility of vehicular principles acting bank assets on the micro-circulation through molecules "carrier" (fosfatidilcolina) and 5-fosfodiesterasi selective inhibitors, from the sildenafil (Viagra TM) to those of last generation (Cialis TM, Vivanza TM, Levitra TM) to doses cutomized for getting a real effect rehabilitative.

We have found a sinergic claim of the therapeutic Association. All the patients have unhidden good results: improvement of the erectile insufficiency, disappeared or attenuation of the signs of suffering of the microcircolo, lowering of the number of auto-injections or them dereliction. The oxygen-ozone therapy by Multiossigen is shown therefore complementary to the availment of other therapeutic benefits, prescribed in specialistic circle Andrologic. It can be in partnership to prepared, to assume for by oral, to base of "Free-Anti-Radical" antioxidant and vasoprotector.
